

Power Design increases order accuracy from 80% to 99.7% with Deposco

Customer Success Story

Overview

Power Design Resources is a national multi-trade design build contractor based out of St. Petersburg, Florida with a focused expertise in lighting products. Unique to their industry, Power Design is known for pre-kitting their products before sending them to the job site, saving time and money.

Prior to implementing Deposco, Inventory fulfillment in their ERP did not provide the data they needed to monitor their operations, or get accuracy above the 80% range, which led to costly delays in construction schedules.

Order accuracy

Solution

The goal in implementing a warehouse management system was to get more accurate and more efficient in the warehouse. With Deposco's cycle counting feature, they increased order accuracy to 99.7% while being able to perform four times more efficiently.

"Our goal by implementing Deposco was to gain the accuracy we were missing using our ERP. With Deposco, we were able to get access to data that we didn't have before, as well as raise our inventory accuracy from 80% to 99.7%."

In addition, the image scanning in Deposco allows them to send what was actually sent to the team onsite. This helps reduce confusion onsite and shows the client exactly how many pallets left the warehouse and how, saving the team in damage and lost goods replacement.

"We are really big on innovation, so when looking for a WMS, we wanted a partner who shared that value. We absolutely love the Deposco team; they are quick to get back to us on new ideas and usually it's implemented in a day or two."
