

Bright Order

Order Management and DOM

Optimize order sourcing and fulfillment from warehouses, third-party logistics providers, and retail stores based on real-time inventory, demand, and location.

Bright Order

Order Management and DOM

When selling products, speed to market and cost-effective shipping are crucial for sales. Responding quickly to new channels of business and increased variety requires that you can identify the optimal location of inventory for fulfillment.

To reduce shipping costs and quickly orchestrate the overall fulfillment process to meet customer demands, processes including order sourcing, inventory allocation and distribution release with warehouses, stores, suppliers and partners must be automated. Our cloud-based Bright Order solution makes managing and distributing orders to optimal sources faster and cheaper.

Included in Bright Order is Sales Order Entry functionality that allows sales teams, customer service reps and order entry clerks to capture sales orders for invoiceable customers of record, using the catalog of items for sale in Deposco. Orders can then be further processed on the Deposco platform to fulfill the order, and integration features are used to notify other systems of record such as passing the order to an ERP or accounting system for invoicing.

- ✔ Integration and management of orders from every channel for true distributed order management (DOM)
- ✔ Cloud-based, real-time order visibility from any device
- ✔ Online sales order entry for improved data capture and fulfillment with customer service or sales reps
- ✔ Faster order processing and improved order to cash
- ✔ Process discounts, returns, refunds and promotions
